ALLOC-X

POLICY-BOUND TREASURY INTELLIGENCE FOR AFRICA

Tell Alloc-X who to pay and why. It selects the right allocation, checks every rule, stops unsafe instructions, executes the authorized XRPL payment, reconciles the ledger result, and returns a verifiable receipt.

ALLOCATE • PROTECT • SETTLE • PROVE

PROJECT CONCEPT • AGENTIC FINANCE

One instruction. The right money. A safe payment. Proof.

Alloc-X is an autonomous treasury allocation and payment system for organizations that manage several budgets, grants, reserves, or programme funds. It converts a plain-language payment request into a controlled, end-to-end settlement while keeping policy, approval, and signing powers outside the agent.

AUTONOMOUS

Plans and executes the complete payment flow.

CONTROLLED

Cannot rewrite limits, approve itself, or hold signing keys.

VERIFIABLE

Links the decision, policy, ledger result, and receipt.

Prepared for W3Node Node Engine 2026 • November 2026

01

The problem and the people

A real treasury problem with an Africa-first operating context

The problem is not sending money. It is sending the right money under the right rules.

Across Africa, NGOs, growing businesses, universities, health networks, and public programmes often manage several pools of money at once: donor grants, project budgets, payroll reserves, departmental limits, procurement votes, and emergency funds. A payment may be affordable overall but still be ineligible from the allocation selected for it.

Today, finance teams frequently reconcile these rules across spreadsheets, documents, messages, and separate approval chains. This slows legitimate payments and increases the chance of using the wrong budget, paying a changed wallet, repeating an invoice, bypassing a limit, or producing weak evidence after the money has moved.

A treasury agent should be able to act—without being able to rewrite the rules that govern it.

Alloc-X separates intelligence from authority: the agent proposes and executes; human-approved policy and independent security controls decide what may proceed.

TARGET USERS IN AFRICA

01 NGOs, civil-society and development programmes

Manage donor conditions, programme budgets, approved vendors, evidence, and reporting without charging one project for another project's cost.

02 SMEs and project-based businesses

Protect payroll and working capital, pay suppliers on time, separate contracts or branches, and reduce dependence on manual treasury checks.

03 Universities, research and health networks

Control sponsor funds, procurement rules, departmental budgets, and multi-location spending with a clear evidence trail.

04 Government agencies and public programmes

Expansion stage: apply budget codes, procurement approvals, separation of duties, spending limits, and transparent programme-level reporting.

DESIGNED AROUND AFRICAN OPERATING REALITIES

Lean finance teams • multiple locations • intermittent connectivity • donor and procurement controls • strong demand for transparent, low-friction settlement

02

What Alloc-X can do

Five connected capabilities, explained without technical jargon

01

Understand, allocate and plan

- Accept a simple instruction naming the approved payee, amount, and purpose.
- Read trusted balances, obligation, evidence, beneficiary, due date, and policy.
- Choose an eligible allocation, reserve capacity, protect minimum reserves, and recommend timing.
- Forecast cash runway and safely re-plan after review or block.

02

Use the Approval Layer and Security Layer

- Approval Layer returns ALLOW, REVIEW, or BLOCK; the Security Layer keeps non-allowed instructions away from the signer.
- Enforce amount, purpose, asset, time, reserve, beneficiary, evidence, velocity, and approval rules.
- Prevent self-approval and cross-organization access; separate requester, approver, officer, and signer.
- Turn policy documents into traceable draft rules, simulate changes, and require independent human publication.
- Authorized humans version, activate, revoke, or roll back policy; change limits; freeze activity; and manage exceptions.

03

Execute the complete payment flow

- Create one tamper-evident instruction from trusted records—not a browser-supplied wallet or amount.
- Collect independent signatures, build the exact XRPL transaction, submit once, and wait for validation.
- Use a separate monitor to reconcile the result, finalize accounting, and flag unknown outflows.
- Show the timeline from request through control, settlement, reconciliation, and receipt.

04

Stop fraud, manipulation and payment mistakes

- Verify wallet changes, require dual control, apply cooling periods, and block destination substitution.
- Inspect evidence without letting document text control the agent.
- Detect duplicates, split-payment attempts, unusual activity, and procurement mismatches.
- Stop altered, expired, unauthorized, high-risk, or unverifiable instructions before signing.

05

Recover, prove and work without an internet signal

- Recover decisions and payment state after a restart without paying twice.
- Create a tamper-evident receipt linking policy, evidence, decision, signatures, budget movement, and XRPL result.
- Maintain a hash-linked audit trail, monitor service and signer health, alert on unknown outflows, and protect sensitive data.
- Offline: capture evidence, draft allocations, and collect local attestations in an encrypted journal; reconnect, synchronize, re-check, then settle online.
- Use nonprofit, commercial, and public-sector policy packs without changing the secure payment core.

Offline safety rule: no treasury signing key is stored on the offline device, and an offline draft is never displayed as settled. Final payment requires fresh online validation.

03

From one instruction to final proof

The agent completes the flow; independent controls keep the treasury safe

1 ASK

User names approved payee, amount, and purpose.

2 ALLOCATE

Alloc-X finds an eligible budget and reserves capacity.

3 CHECK

Approval Layer decides; the Security Layer enforces ALLOW, REVIEW, or BLOCK.

4 SIGN

Independent signers verify the exact transaction.

5 SETTLE

The transaction is submitted and validated on XRPL.

6 PROVE

A separate monitor reconciles and produces a receipt.

If the outcome is REVIEW or BLOCK, nothing is signed. Alloc-X explains the reason and requests only a policy-permitted next action.

WHY THIS IS UNMISTAKABLY AGENTIC FINANCE

Autonomous action

Selects the allocation and carries an allowed payment through validation and reconciliation.

Treasury management

Understands balances, commitments, reserves, eligibility, timing, and cash runway.

Onchain execution

Turns an allowed instruction into an exact XRPL transaction and final ledger evidence.

Limits outside the agent

Policy, Approval Layer, Security Layer, beneficiary controls, and signer quorum cannot be edited by the model.

Human governance

Operators manage limits, approvals, freezes, policy publication, and exceptions.

Bounded tools

MCP-compatible contracts expose approved actions without raw keys or unrestricted access.

VALUE TO RIPPLE AND THE XRP LEDGER ECOSYSTEM

- Creates repeatable XRPL usage from real organizational payments—not only retail transfers or speculative activity.
- Demonstrates a reusable safety pattern for AI-controlled finance: human policy, independent approval, quorum signing, ledger validation, and receipts.
- Expands XRPL relevance in Africa across NGOs, SMEs, research institutions, and public programmes.
- Shows how XRPL speed, deterministic transactions, multi-signing, and public transaction evidence support accountable treasury automation.

04

Development impact and selection case

A measurable contribution pathway—not an unsupported impact claim

SUSTAINABLE DEVELOPMENT GOALS ADVANCED

08

Decent Work & Economic Growth • 8.3

Stronger SME finance operations; protected payroll and working capital; more reliable supplier payments.

Measure: on-time payments, hours saved, reserve breaches prevented

09

Industry, Innovation & Infrastructure • 9.3 / 9.b

Africa-led financial technology and better operating infrastructure for small enterprises.

Measure: organizations onboarded, controlled payments, policy packs deployed

16

Peace, Justice & Strong Institutions • 16.5 / 16.6

Fewer unauthorized or manipulated outflows and transparent, policy-linked evidence.

Measure: high-risk attempts blocked, receipts verified, unmatched outflows resolved

17

Partnerships for the Goals • 17.17

Stronger accountability across donors, civil society, businesses, and public programmes.

Measure: evidence-complete payments, reporting time, partner exceptions resolved

WHY ALLOC-X DESERVES A CLOSER LOOK

REAL PROBLEM

Budget eligibility, payment safety, and auditability.

FULL EXECUTION

Instruction to XRPL validation, reconciliation, and proof.

SAFE AUTONOMY

Acts without controlling its own policy or keys.

AFRICA-READY

Lean teams, weak connectivity, reusable organization packs.

BUILT TO PROVE

Reason codes, hashes, recovery, and verifiable receipts.

Alloc-X is not an AI that merely suggests a transfer. It is a controlled financial operator that can decide, execute, recover, and prove—while the organization remains in charge.

05

Beyond the Build: A Launchable, Profitable Company

A capital-light B2B model with recurring revenue, transaction-linked upside, and a measurable path to scale

THE INVESTMENT CASE

Alloc-X can become the trust and execution layer for organizations that need AI speed without giving AI unchecked control of money.

Start with policy-bound payments for African NGOs and SMEs; expand through higher volume, more departments, integrations, and reusable organization policy packs.

HOW ALLOC-X MAKES MONEY

PLATFORM SUBSCRIPTIONS

Starter: $99–$199/month
Growth: $399–$799/month
Institutional: from $1,500/month

SUCCESSFUL PAYMENT USAGE

$0.25–$1.00 per reconciled payment, with volume caps. No usage fee for blocked or review-only instructions.

ONBOARDING & INTEGRATION

Paid setup for policies, ERP or accounting links, identity systems, migration, training, and service levels.

PREMIUM & PARTNER REVENUE

Advanced fraud controls, analytics, custom policy packs, white-label APIs, and channel partnerships.

THREE-YEAR MANAGEMENT SCENARIO

YEAR	PAYING ORGS	MARKETS	YEAR-END ARR	TOTAL REVENUE	PAYMENT VALUE CONTROLLED
1	50	2	$0.18M	$0.25M	$12M
2	220	5	$0.92M	$1.32M	$90M
3	750	10	$3.78M	$5.20M	$450M

Illustrative—not guaranteed. Assumes blended monthly subscription revenue of about $300, $350, and $420 across Years 1–3; regional pricing; paid-pilot conversion; low churn; and growing onboarding and usage revenue.

WHY GROWTH CAN COMPOUND

LAND

One programme, branch, or payment workflow.

EXPAND

More budgets, users, beneficiaries, policy packs, and volume.

DISTRIBUTE

Auditors, accountants, ERP partners, donor platforms, and XRPL partners.

EXTEND

Universities, institutions, and public programmes.

METRICS THAT PROVE THE MODEL

- Pilot-to-paid ≥40%; first value ≤7 days
- Gross retention ≥90%; net revenue retention ≥115%
- Customer acquisition payback ≤12 months
- Target gross margin 75–82%
- 100% receipts; zero duplicate settlements

PATH TO PROFIT

A lean team reaches operating break-even at roughly 250–350 active organizations—around late Year 2 to early Year 3 in the base scenario.

Capital-light: Alloc-X sells software and controlled orchestration; it does not lend customer money or need custody of treasury funds.

WHY ELEVATE ALLOC-X NOW

A painful recurring problem, subscription revenue, low marginal software cost, defensible security infrastructure, and a clear route from an Africa-first launch to institutional scale.

Market context: IFC identifies MSMEs as the backbone of African economies; GSMA reports 416 million mobile-internet users in Africa while nearly 75% remain unconnected—supporting both the digital opportunity and the no-signal design. Forecasts are internal planning assumptions to validate through paid pilots.
